Tables (Data); Two Year College Students; Two Year Colleges

ABSTRACT

The National Profile of Community Colleges comprises text and charts that provide an overview of American community colleges. The report highlights major issues concerning community colleges and provides detailed representation of trends in enrollment, funding, and other areas. Chapter 1 recounts the history of community colleges and summarizes important current issues. Chapter 2 discusses student characteristics. Chapter 3 describes student and community outcomes as measured by indicators such as degrees and certificates awarded, employment data, and cost-benefit analysis. Chapter 4 describes community college staffing and discusses changes due to large numbers of staff retirements and increases in adjunct faculty. Chapter 5 discusses finances, expenditures, and revenues. Chapter 6 discusses the future implications of technology for community colleges. The statistics presented in this report are drawn from a variety of sources, including AACC surveys, scholars, and the U.S. Department of Education. (Contains 63 tables, 38 figures, and 45 references.) (AUTH/RDG)

COMMUNITY COLLEGE PRESS®
a division of the American Association of
Community Colleges
Washington, D.C.

The American Association of Community Colleges (AACC) is the primary advocacy organization for the nation's community colleges. The association represents 1,100 two-year, associate degree-granting institutions and some 10 million students. AACC provides leadership and service in five key areas: policy initiatives, advocacy, research, education services, and coordination/networking.

PREFACE

The *National Profile of Community Colleges* comprises text and charts that together provide an overview of America's community colleges. The text highlights major issues concerning community colleges, while the figures and tables provide a detailed representation of trends in enrollment, funding, and other areas.

Chapter 1 recounts the history of community colleges and summarizes some of the most pressing issues confronting them now. Chapter 2 discusses the number and diversity of community college students. Chapter 3 describes the effects community colleges have on their students and communities as measured by such indicators as degrees and certificates granted, employment data, and cost-benefit analyses. Chapter 4 touches on community college staffing and changes taking place due to the large number of staff retirements and

the increases in adjunct faculty. Chapter 5 focuses on the financial health of community colleges by listing and analyzing their expenses and their revenue sources. Chapter 6 looks to the future by considering the ways technology fuels competition and influences demographic, economic, and academic concerns.

Serving millions of constituents whose needs are varied and complex, community colleges will face enormous challenges in the 21st century. To continue to thrive, they will need the vision that their creators exhibited a century ago as well as the missionary zeal of those who opened hundreds of community colleges in the 1960s. Community college educators must continue to operate at the cutting edge of higher education, where problems are embraced as opportunities. The *National Profile* helps document this ongoing process.

The *National Profile's* statistics come from several sources, including AACC surveys, scholars from the community college field, and the U.S. Department of Education. Consequently, numbers may vary across the many tables and figures despite efforts to report statistics consistently. Overall enrollment is reported using full-year, unduplicated headcounts. This method counts each student once for the academic year regardless of how many terms he or she attended classes. Breakdowns within student enrollments are not available for full-year, unduplicated headcounts, however. Race, sex, age, and other demographic information are reported based on fall semester attendance, which accounts for just 60 percent of the full-year enrollment. In some cases, statistics may not add up to 100 percent because of rounding.

REPORTING OF NONCREDIT ENROLLMENT

The *National Profile* focuses on credit enrollment at community colleges not because credit courses are more important than noncredit activity but because no accurate national data exist about noncredit activity at community colleges. The U.S. Department of Education provides definitions and a collection mechanism for credit enrollment through the Integrated Postsecondary Education Data System (IPEDS), but noncredit enrollment has no equivalent.

On a state-by-state basis, some reliable noncredit data is available. For the purposes of this publication, the state numbers cannot be totaled to give accurate national figures, because definitions used to describe both credit and noncredit activities vary from state to state and caution must be used when interpreting

the reports. Interested readers may wish to obtain the information from state community college system offices, however. Following are examples of the type of data available:

- North Carolina reported about 70 percent of 1996–97 community college enrollment as noncredit (232,316 credit students and 563,109 noncredit students).
- Wisconsin’s technical college system reported nearly 70 percent of their 1995–96 enrollment as noncredit (129,673 credit students and 266,998 noncredit students).
- California reported 14 percent of fall 1996 enrollment as noncredit (1,249,680 credit students and 199,868 noncredit students).
- Florida reported 11 percent of 1995–96 enrollment as noncredit (783,154 credit students and 95,870 noncredit students).

AACC estimates that more than 5 million students each year participate in some form of noncredit activity at a community college. Today’s noncredit coursework includes more than personal interest classes. Career, technical, and vocational education make up an important and growing area of noncredit activity. Many colleges offer noncredit classes that lead to some form of vendor certification, and most colleges offer noncredit contracted training to local business and industry, government agencies, and other organizations. AACC hopes to see an increase in the reporting of noncredit enrollment and will continue to monitor the data as it becomes available.

ACKNOWLEDGMENTS

A ACC appreciates the many people and institutions who helped provide information for the *National Profile*. This work is based on research gained through a variety of written and electronic sources, meetings, focus groups, and interviews. Special thanks to the following persons for their willingness to be interviewed:

Richard Alfred
Professor of Higher Education
and Co-Director, Consortium for
Community College Development
University of Michigan, Ann Arbor

Ann Beheler
Instructor

CHAPTER I

COMMUNITY COLLEGES PAST TO PRESENT

COMMUNITY COLLEGES

PAST TO PRESENT

The community college emerged at the beginning of the 20th century during a period of experimentation in all sectors of American education, as the nation sought to bring greater structure and rationality to what had been an unarticulated and often conflicting array of institutions. In keeping with the spirit of the time, the community college—initially known as the junior college—assumed a pivotal role as a bridge between the country’s rapidly growing, egalitarian high schools and tradition-bound senior colleges, professional schools, and universities.

Community colleges evolved from the ideas of several gifted educators, including William Rainey Harper and J. Stanley Brown. As president of the University of Chicago in the 1890s, Harper contended with overcrowded classes and often underprepared students, and he desired to concentrate the university’s resources on the specialized studies of juniors and seniors. He believed the first two years of college could be provided by secondary schools. Brown, principal of the public high school in Joliet, Illinois, saw many students ready to continue their formal

education hindered by the hierarchy of the era. Gaining a seat in a university was highly competitive, and although Brown believed many of his students could succeed academically, most lacked the money to continue their education.

Influenced by Harper’s belief that freshman and sophomore college courses could be taught outside the university, and by his own experience of working to put himself through college, Brown created Joliet Junior College by adding a fifth and sixth year of courses to the high school curriculum, persuading university professors to grant credit to those who successfully completed the courses.

Joliet Junior College is the oldest continuously existing public two-year college, but there were other two-year college experiments started before 1901 that may be thought of as pioneers. Other leaders of the time, including Stanford University president David Starr Jordan and University of Missouri president William Ross, helped popularize the idea that high schools or small colleges could offer the first two years of college work. Also to be credited are the many civic leaders who persuaded local voters to approve the

taxes needed to organize junior colleges, and the numerous benefactors who underwrote much of the construction and operating costs of private junior colleges that developed across the South, the Northeast, and parts of the Midwest.

Junior colleges provided a gateway to opportunity for many young people who otherwise would have been denied access to higher education. The more than 1,100 institutions now known as community colleges grew from these early beginnings. In whatever ways the earliest junior colleges—such as those at Joliet, Illinois; Fresno, California; Kansas City, Missouri; and Rochester, Minnesota—may differ from today's comprehensive community colleges, these institutions have been united across the century by their common mission of providing access to higher education.

Community colleges experienced an early growth spurt in California, when in 1909 the state legislature agreed to help fund high schools' efforts to offer the first two years of college coursework. By 1921, California had the largest system with 21 public junior colleges. In these early years, the colleges focused on general lib-

eral arts studies. During the Depression of the 1930s, community colleges began offering job-training programs as a way of easing widespread unemployment. After World War II, the conversion of military industries to consumer goods created new, skilled jobs. This economic transformation along with the GI Bill created the drive for more higher education options. In 1948, the Truman Commission suggested the creation of a network of public, community-based colleges to serve local needs.

Community colleges became a national network in the 1960s with the opening of 457 public community colleges—more than the total in existence before that decade. Enrollments were fueled by baby boomers coming of age. Parents began to regard college as a necessity for their children, and with the generation's opposition to the Vietnam War and the draft deferment available to full-time students, participation rates soared. The construction involved in this gigantic growth of facilities was funded by a robust economy and supported by the social activism of the time.

As the public colleges grew, independent (private) colleges struggled to keep

up in number and enrollment. With rising operating costs, independent colleges found it difficult to compete with the accessibility, convenience, and low cost of public community colleges. In their struggle to survive, some changed their missions and converted from two-year to four-year institutions. Virtually all of the independent colleges began to bolster their bottom lines through extensive fundraising efforts.

Now collegial partners with baccalaureate institutions and research universities, community colleges educate more than half the nation's undergraduates. In the 1996–97 academic year, 9.3 million people took credit courses at community colleges. Another 5 million took noncredit classes, the majority of which were workforce training courses. Since 1901, at least 100 million people have attended community colleges.

As significant as these statistics are, they provide just a glimpse of the impression community colleges have made and continue to make on the education landscape. Each community college is a distinct educational institution, loosely linked to other community colleges by

the shared goals of access and service. Open admissions and the tradition of charging low tuition are among the practices they have in common. But each community college has its own mission. No two community colleges are exactly alike.

North Carolina's and Vermont's community college systems bring higher education to within a 30-minute commute of all their citizens, an access goal many states share, and they exemplify how different practices can accomplish the same end. North Carolina has a 58-campus system, which 800,000 people used in 1997–98. Seventy percent of those students took noncredit programs, mostly in workforce training. The Community College of Vermont (CCV), with much less support than North Carolina from its state legislature, owns no real estate and has no full-time faculty. CCV rents classroom space in 12 population centers throughout the rural state and is expanding its distance learning systems. About half of its 4,500 students take general liberal arts courses with the intent of transferring to baccalaureate degree programs. Variations like these do not arise

from geography alone but reflect the differences in each area's population. Most mission statements and institutional goals are developed with local community college trustees, who are elected or appointed by elected officials.

Most of the 31 tribal colleges that exist today started in the late 1960s and early 1970s with the dual mission of perpetuating traditional Native American cultures and providing a general postsecondary education for reservation residents. Recruiting college-educated Native Americans to return to reservations to teach is an ongoing challenge for these colleges. The low and fluctuating amount of funding—primarily from the Bureau of Indian Affairs, tuition, and grants—also inhibits expansion of course offerings that might attract more students. Although some tribal colleges offer selected four-year degrees, primarily they offer the associate as their highest degree, so they are considered community colleges.

The idea of learning as a lifelong pursuit took hold as Americans became more educated. Conveniently located community colleges became the supplier of recreational as well as academic and voca-

tional knowledge in the 1970s and 1980s. In 1988, with society becoming increasingly fragmented, the Commission on the Future of Community Colleges recommended that community colleges help build a sense of community by creating partnerships and making facilities available to civic groups.

Community colleges have distinguished themselves in their willingness to provide basic computation, composition, and reading classes to help students meet their ultimate goals. Although community college students historically have been admitted to the college without prequalifications, they must complete all prerequisites and requisites to earn a degree. Open admissions remains a tenet of community colleges, but decisions about remedial education threaten to erode these policies.

The practice of offering remedial education came into question anew in the 1990s as the number of students needing basic academic instruction grew and public funds became more limited. Because of the high number of remedial students and colleges' tight budgets, many community colleges are wrestling with several ques-

tions: How many times should a student be allowed to repeat a course? When space is limited, should preference be given to the student who needs just one remedial course or the one who needs several? Who should bear the costs of these developmental programs? How should other aspects of colleges' missions be maintained when their role as remediators is increasing? The exact number of remedial students is not available, but the extent of the problem is apparent given that Texas, alone, had 233,545 community college students in remedial classes in fall 1997.

Keeping student costs affordable also remains a challenge. "No new taxes" and downsizing government obligations have been prevailing themes in American politics since the late 1970s. Only as the economy improved in the late 1990s did community colleges and other public sectors begin to receive funds much in excess of inflationary increases. In such an economic climate, community colleges have struggled to maintain services and keep up with rapidly changing, expensive technology. Many colleges have had to

increase tuition to fill the funding gap.

Budgetary pressures have been heightened by taxpayers' and legislators' desire for proof that public money is well spent. In many states, community colleges must meet performance standards in exchange for increased funding. But community colleges, which have more part-time students than full-time students, have long contended with funding formulas based on full-time-equivalent students. New pressure to disperse money based on easily quantifiable measures, such as graduation or certification within specific time frames, do not readily fit community college attendance patterns or students' academic goals.

Community college students are more likely than their counterparts at four-year institutions to balance work and family responsibilities. If a part-time student takes five years to attain an associate degree, does this indicate institutional or personal problems, or does it confirm the individual's determination? Trying to capture the progress of students who take just one or two work-related courses poses similar questions. Are these dissatis-

fied dropouts? Or, did these students get what they were looking for to advance their careers or otherwise improve their lives, and move on to other pursuits?

The hybrid of publicly funded college courses at close-to-home facilities welcomed into higher education those who in another time and place would have been considered not eligible. It is this inclusiveness—dependent on one’s desire to learn rather than on wealth or heritage—that makes community colleges quintessentially democratic. While the diversity of community colleges’ students and programs is a strength, it also provides a constant challenge. Setting educational priorities, meeting students’ needs, and responding to community concerns is a complicated balancing act for administrators, trustees, faculty, and staff. Core community college principles like accessibility, affordability, and flexibility create stress the way freedoms guaranteed by the Bill of Rights simultaneously unite Americans and generate tensions among them.

Community colleges continuously gather and interpret data to report suc-

cesses and failures, both for accountability reasons and to ensure their viability in fiscal terms. With increased competition from for-profit colleges and distance education providers, administrators who want their community colleges to be around for another century need to know what they are doing right and what they need to improve.

In the 20th century, community colleges have not only survived, they have thrived. Community colleges have demonstrated remarkable resiliency, becoming centers of educational opportunity open to all seekers. They pride themselves on providing educational marketplaces where student choices and community needs influence course offerings. The American Association of Community Colleges will recognize the 100th anniversary of community colleges in 2001, marking a century in which community colleges have helped millions of people learn and advance toward personal goals, while providing a forum to address challenges facing whole communities.

- ☐ Between 1960 and 1970, the number of community colleges increased two and a half times, opening at a rate of nearly one per week.
- ☐ Community college enrollment between 1965 and 1975 increased almost three and a half times.
- ☐ Enrollment growth slowed between 1982 and 1992 to average about 2 percent a year and has been relatively stable since then.
- ☐ In 1998, there were 1,132 public and independent community colleges in the United States, with at least one in every state.
- ☐ Unlike public community colleges, many independent community colleges are affiliated with churches or cater to an all-male or all-female student body.

FIGURE 1.1 □ NUMBER OF COMMUNITY COLLEGES INCLUDING BRANCH CAMPUSES: 1905–1998

□ Source: National Center for Education Statistics 1998b; AACC data files

- The continued growth of community colleges in the 1990s may be attributed to several newly built institutions and to a change in the structure of several institutions. Some converted from technical institutes awarding postsecondary certificates or diplomas to regionally accredited colleges awarding degrees.

CHAPTER II

STUDENT ENROLLMENT AND CHARACTERISTICS

STUDENT ENROLLMENT AND CHARACTERISTICS

Community college students bring a mix of diverse characteristics to their campuses: youth and age, financial comfort and financial need, racial and ethnic variation. One characteristic they share is a desire to improve themselves. Reasons for choosing to attend a community college are as varied as the individuals. Low tuition, convenient locations, open admissions, and comprehensive course offerings—all attributes of community colleges' commitment to accessibility—are highly persuasive factors in students' personal calculations.

Low tuition tips the scale in favor of community college for many people when they are weighing higher education options. The low cost of community colleges relative to four-year or for-profit institutions has universal appeal but is especially important to people with low income.

Most public community colleges have transfer agreements with baccalaureate institutions by which the senior institutions accept community college credits toward four-year degree requirements.

Many traditional college-aged students—those between 18 and 22 years—as well as

nontraditional degree seekers opt to stay at home and complete their freshman and sophomore years of coursework at a community college. Doing so cuts the cost of a four-year degree significantly. Ambitious teenagers also use these transfer agreements to their advantage by taking advanced placement classes that are more challenging than courses offered by their high school and which count toward their college degrees.

The location of community colleges near residential areas—whether in cities, suburbs, or rural areas—is important to many people. Women with young children, for instance, put a premium on convenience because they frequently take classes around their own and their spouses' work schedules, and babysitters' availability. For women entering the workforce for the first time or reentering after a hiatus, community colleges' proximity eases their transition to work. It's no surprise, then, that community colleges are a popular choice with women, who make up 58 percent of all community college enrollees.

Minority students also favor community colleges. Black, Hispanic, and other

minority students make up 30 percent of community college enrollments nationally. In urban areas, community college enrollments reflect the proportion of minorities in local populations. In some urban community colleges, more than 50 percent of the students belong to one or another minority group. At tribal colleges, founded to explore traditional tribal cultures as well as to address Western learning models, most of the students are Native American.

Community colleges' commitment to being actively involved in local communities also helps attract minority students. Collaborations with businesses and social service agencies extend community colleges' presence beyond their architecture. In this way they are familiar, more approachable institutions, especially for people whose families do not have experience with higher education. In family-centered cultures that like to keep teenagers and young adults close to home, community colleges provide the opportunity for people to advance their education at places they know firsthand while retaining their family ties.

Offering classes in English as a second language typifies community college

academic activities that respond to community needs. Teaching English to immigrants helps them crack the written and spoken code in their new homeland. It also brings immigrants onto campuses, exposing them to other courses and students. This sends a powerful, positive message to immigrants: A college education in the United States is not a luxury reserved for someone else; it is a possibility for you and your children.

Meanwhile, open admission policies give adults who were less than studious in high school a second chance. These policies guarantee admittance to the college, though not to all the classes. Most community colleges test incoming students and require completion of prerequisites before students can take advanced classes. The goal is not to keep unqualified people out but to give them the tools in remedial classes that they need to succeed in their ultimate goals.

Developmental education courses at community colleges keep open the possibility of degree programs and highly technical vocational training for those who need to improve reading, writing, and computation skills.

The multitude of community college courses and the various times they are offered—mornings, afternoons, evenings, and weekends—allow working people to fit higher education into their schedules. With the increasing use of the Internet and other distance education media, students have the power to decide when and how they will learn. These options appeal particularly to community college students, more than 80 percent of whom balance studies with full-time or part-time work. Many students also have family responsibilities.

Community colleges report a new enrollment phenomenon in the growing number of students with bachelor's and other degrees who choose to come back

to community college. They attend for computer classes and other instruction in order to keep up with the technology that permeates work and leisure activities. Certification programs or workforce training classes continue to appeal to people who want to move up the ladder in their current job as well as to those who want to obtain different work that requires a particular skill.

At community colleges, people can continue to learn at any point in their lives. The fast pace of technological innovations and increasing frequency of job and career changes create the potential for people to return to community colleges again and again.

□ Noncredit enrollment is not shown among these tables and figures. State noncredit enrollment numbers cannot be totaled to give accurate national numbers, because definitions used to describe credit and noncredit activities vary from state to state (see also note on page xi).

CHAPTER

III

THE COMMUNITY COLLEGE IMPACT

THE COMMUNITY COLLEGE IMPACT

Consumers of higher education, like other consumers, look for good value. Community college students want to learn things that will have a positive effect on their lives. They want college to be nearby, with convenient class schedules and low cost. Legislators want measurements of effectiveness. Employers want workers with analytical and technical skills. Taxpayers want to make sure their money is well spent.

Community colleges exist to help people attain their personal goals through education. In their course offerings and services, community colleges try to accommodate a broad range of aspirations. It is this breadth of programming and the variety of students' goals that make it difficult to accurately quantify community colleges' performance. Unlike four-year colleges, where attainment of a bachelor's degree is the implicit goal of all who enroll, community college students do not share a common goal beyond self-improvement.

Community colleges offer a variety of credit and noncredit programs in occupa-

tions that the Bureau of Labor Statistics predicts will be in demand early into the next decade. These include computer technologies, healthcare services and management, and public relations. Overall, the number of occupations requiring an associate degree is expected to increase by more than 20 percent through 2006.

Completion of a program, particularly in fields where there are job openings, is a key variable in determining the economic impact of a community college education, according to W. Norton Grubb of the University of California, Berkeley. Grubb found that community colleges and non-baccalaureate postsecondary institutions "do allow individuals to advance into 'better' jobs." Those who complete associate degrees and certificates are more likely to move into higher-status managerial and professional positions with higher earnings. Grubb (1998) also notes that the additional benefits of a four-year degree are sometimes small. "English majors from four-year colleges earn less than technicians or health professionals with associate degrees."

To ensure that students reap the benefits of their investment of time and money, many colleges are enhancing academic advising to help students match their goals with appropriate courses. Colleges are reexamining their offerings, including noncredit courses, and, where needed, are reconfiguring courses so they count toward degrees.

AACC periodically surveys colleges about “hot” programs. These are programs from which graduates are hired before or immediately after graduation, such as nursing, computer technology, auto technology, and law enforcement. According to a 1997 survey, hot program graduates earned an average starting salary of \$25,500, about 15 percent more than the hot program starting salaries reported in 1994. The 1997 survey found particularly strong growth in the number of information technology programs community colleges offer and in the entry-level salaries of those who complete these courses of study.

Although the statistics about the economic benefits to individuals are

encouraging, the issue of what society gains from supporting higher education continues to fuel many legislative budget debates. Victor Ukpolo and Thomas F. Dernburg, working for the Tennessee Board of Regents, tackled this nagging question and came to the conclusion that higher education yields significant returns to students, to the state, and to society.

Ukpolo and Dernburg reported, using 1993 as the base year, that for every dollar Tennessee invests in higher education, society can expect an average real return of \$9.30. The cost-benefit ratio to society for a two-year associate degree is even higher at \$10.52. These gains are much higher than the profits that could be expected from alternative investments such as U.S. treasury notes or corporate AAA bonds. “Public investment in human capital clearly pays ample real financial dividends both to the educated individual and to society as a whole,” Ukpolo and Dernburg wrote of their findings in the *Journal of Business and Economic Perspectives*.

Ukpolo and Dernburg's analysis found that the state recovers the cost of its subsidy to higher education in sales taxes alone. This happens as more highly educated people earn more money and increase their spending, which yields more in sales taxes. In Tennessee, a man with an associate degree earns about \$127,144 more during his lifetime than a man with a high school diploma alone. On average nationally, a graduate with an associate degree can expect to earn \$250,000 more than a person whose highest level of educational attainment is a high school diploma.

Still, evaluating community colleges solely on the basis of associate degrees

and certificates granted or on the number of students transferring to four-year colleges misses major aspects of community colleges' endeavors. Such narrow measures overlook the powerful changes that occur when an immigrant masters English as a second language at a community college or when impoverished people get training that frees them from public assistance programs. Traditional measures may not consider the importance of businesses getting new customers because their workers, retrained at a community college, can handle complicated new technology.

Success at community colleges must be broadly defined to include not just

those who attain associate degrees—more than 450,000 in 1996–97—and those who earn certificates—nearly 170,000 in 1996–97—but also the millions who take noncredit and workforce training classes. Assessments must consider whether those who attend community colleges are able to improve themselves. Ideally, measures of success would also consider whether community colleges and their graduates make positive contributions to society.

Educators have long relied on heartwarming true stories to illustrate community colleges' successes. A young Marine veteran leads the student government at Bronx Community College while he works full time and takes classes for his

associate degree. A single mother uses her aviation technology degree from Tarrant Junior College to create a stable economic life for herself and her child. A Native American woman who began at Pike's Peak Community College unprepared, on welfare, and with a child to support, went on to earn a doctorate in environmental toxicology and teach at a university even as she continues to lead outreach efforts to enhance the lives of Native American children.

Although the definitive measure of educational quality and success evolves, community colleges allow students from all walks of life to work toward and attain the goals they have set.

- **Community college graduates—those who leave college with associate degrees—earn 24 percent more than persons whose highest level of educational attainment is a high school diploma.**
- **Community colleges award nearly 500,000 associate degrees and 200,000 certificates annually.**
- **Of students who began their college careers in the 1989–90 academic year, more than one-third earned a degree or certificate within five years; another 15 percent were still enrolled at a post-secondary institution after five years.**
- **Some community colleges—most notably independent ones—are transforming themselves into four-year institutions that offer baccalaureate degrees.**

- ☐ The majority of associate degrees awarded are in general education/liberal arts, while certificates are mostly awarded for occupationally specific training.
- ☐ In the 1996–97 academic year, community colleges awarded more than 76,000 associate degrees in allied health fields, training a significant number of employees serving the nation's healthcare needs.

CHAPTER

IV

COMMUNITY COLLEGE STAFF AND SERVICES

COMMUNITY COLLEGE STAFF AND SERVICES

Community colleges are in the midst of a transition brought about by numerous retirements among administrators and faculty members. Many of the people retiring have been working at community colleges since the expansion of institutions during the 1960s. Personal and professional history is lost when someone retires, but the potential for new energy and insight balances some of the losses.

Many colleges are using the opportunity to create more inclusive staffs, and increasingly women and members of minorities are being selected to fill leadership positions. Nationally, roughly one-third of all community college presidents hired during the 1997–98 school year were women. Women make up about 18 percent of community college chief executives overall.

Although compensation for community college presidents still lags behind those for top administrators of four-year institutions, in recent years the gap

between salaries for full-time community college faculty members and those of their counterparts at four-year institutions has narrowed. This not only benefits faculty members personally but has helped community colleges stabilize their full-time teaching staffs. On the other hand, the trend toward pay increases has prompted many community colleges to hire more adjunct faculty, who are paid considerably less than tenured or tenure-tracked associates.

Adjunct instructors have long been part of community college staffs for reasons beyond economics. People are typically hired for adjunct positions because they possess technical skills and knowledge that are beneficial to students. Their expertise and workplace experience helps keep curricula fresh. Because part-time instructors typically have other income sources, the lower pay they accept as secondary income helps community colleges balance their budgets.

The way adjunct instructors are

hired—on a per-course, per-semester basis—presents some problems, however. Many are hired just weeks or days before classes begin, which makes lesson planning difficult. Though many are experts in their field, they may not be trained as educators and sometimes have difficulty conveying their knowledge. Not all community colleges give the appropriate pedagogical assistance needed for adjunct instructors to improve their teaching techniques.

At many colleges, the full-time and part-time staffs have little contact with each other. Students of part-time instructors are sometimes at a disadvantage because adjunct instructors may not be as accessible as full-time faculty. Adjuncts also may not have administrative or student-advising responsibilities; these tasks are left to a shrinking number of full-time faculty members. Finding the proper balance of full-time and part-time faculty members is an ongoing challenge at most community colleges.

Community colleges, like most other educational endeavors in the United States, rely heavily on the traditional format of instructors lecturing to students. But as research on learning styles increases, along with the popularity of distance education, faculty members are encouraged to adjust their teaching methods to the various learning styles of their students. In addition, they are asked to reconsider what they call success. For example, one requirement for community college faculty is shifting from certifying that a student has spent the requisite number of hours in class and passed written tests, to facilitating learning and having students demonstrate their understanding of the information and mastery of the skills taught in the course. The push for measurements of competencies comes mainly from employers who want people who can perform the skills they need in the workplace and from legislators who hold the colleges responsible for students' performance.

Technology presents a challenge for some faculty members, and it presents challenges for the college in determining equitable faculty pay. Faculty salaries often are based on the amount of time instructors spend face-to-face with students. As more instruction occurs in computer labs and over the Internet, some modification of this structure is expected. With the advent of Internet courses, administrators and faculty grapple with questions about who owns courses and whether faculty members who develop courses deserve compensation when the courses are re-transmitted to other institutions and to individuals outside the community college district. New technologies also create the potential for instruction tasks to be divided. The course developer may not be the person who checks electronically submitted assignments or who answers students' questions by e-mail. Determining reasonable compensation for these jobs, which do not easily fit

collective bargaining agreements, proves to be an issue at many colleges.

Community colleges must work to attract and retain technology experts, who may have the potential to earn more money from industry. The battle for computer instructors and others with technological expertise is similar to the intense competition community colleges have long experienced when recruiting tradesmen and others whose skills are in high demand.

Community colleges seek to build more than the intellectual capital of their enrolled students. Community colleges also endeavor to build their communities and the sense of community among those residing in the geographic areas they serve.

As a complement to their large variety of courses, many community colleges provide services that make them a resource for area residents as well as for students. Local theater companies or visiting lecturers may be allowed to use the

community college auditoriums. At urban campuses, particularly, colleges often allot space for services ranging from AIDS prevention to senior citizen lunches. In rural areas, community colleges help drive economic development. The colleges reach out to high school and middle school students with special programs that bring teenagers onto campus. The goal is to get young people thinking about college and preparing for college when they select their high school courses.

Childcare services at many campuses make it simpler for students with children to attend classes and to study. Three community colleges in the City University of New York system have taken this concept a step further with Family Colleges that provide preschool and primary grade classes to students' children at campus facilities.

In addition, the educational and social services available at community colleges have made them favorite launching pads

for welfare reform efforts aimed at getting public assistance recipients working.

Many colleges offer specific job training, work skills workshops, job placement, and follow-up counseling for welfare recipients, along with basic skills and English-as-a-second-language courses.

Community colleges have excelled in providing support services to individuals with disabilities. In addition to assessments and counseling, many community colleges provide tutors and special learning materials to disabled students. Some colleges assist disabled students with housing and transportation.

Through constant evolution and ever-changing technologies and student needs, community colleges' overriding goal remains to provide up-to-date, quality education and services to a varied public.

□ Community colleges employed nearly 500,000 faculty and staff in the 1997-98 academic year.

CHAPTER

STUDENT COSTS AND COLLEGE FINANCE

STUDENT COSTS AND COLLEGE FINANCE

Community colleges are a good value for students and taxpayers, and keeping education affordable for students is the main way community colleges fulfill their commitment to access.

Tuition and fees at public community colleges average less than half those at public four-year colleges and about one-tenth those at independent four-year colleges. In return for their investment, taxpayers benefit from institutions that provide a broad cross-section of students with the skills needed to participate fully in the economy. Community college students learn in relatively small classes from instructors whose primary responsibility is teaching, not research, and average student-teacher contact time is higher at community colleges than at other higher education institutions.

Although community colleges have long relied on the triumvirate of local, state, and federal appropriations for revenue, state funding is the key budget variable. Generally, where state support is high, tuition is low. Many community colleges were charging little or no tuition when the first budget cuts were launched from state capitals 20 years ago. Tuitions have since increased to make up for the

funds lost to voters' demands for tax relief and other government sectors' demand for funding. Tuitions, however, have not filled the gap. For years revenues barely kept pace with expenditures, and financial belt tightening became the standard operating procedure on community college campuses.

As labor-intensive enterprises, many community colleges have tried to trim their expenses by hiring part-time faculty. Nevertheless, salaries and benefits for faculty remain the largest part of community college budgets, averaging 30 percent of expenditures in 1996–97.

Direct federal appropriations have dropped since 1980. These, however, have been replaced by large increases in federal grants and contracts to community colleges. The federal government has become the primary source of the financial aid. More than 30 percent of all Pell Grants—federally financed cash disbursements given to students based on family financial need—go to community college students. Federal student loans, which must be repaid, also have increased in number and size during the past decade.

Overall, local funding has remained a steady portion of community college

budgets. Some community colleges have delved into fundraising, particularly for scholarships. Endowments, while growing, are small compared with those at four-year institutions.

The state budget surpluses generated by the more robust economy of the mid-1990s provided some relief. New Jersey's 19 public community colleges, for instance, agreed not to raise tuitions for 1998–99 because the state increased the community college appropriation by nearly \$20 million and set aside \$120 million for capital improvements.

Concerns about accountability mean that new funds frequently come with performance goals attached. Kentucky's restructuring of community colleges' governance includes monitoring students' college attendance, enrollment in credit courses, and graduation. The colleges are also evaluated based on measures of academic quality, student progress, community service, and workforce development. Tennessee's Board of Regents publishes a report card that grades community colleges, technical colleges, and universities on students' graduation and employment, faculty productivity, and institutional financial management, among other areas.

The financial stress has prompted community colleges to collaborate with other institutions and corporations, especially for new technology. Washington's K–20 Network electronically links the community colleges with the state's public schools and universities for a variety of distance learning options. The Virginia Community College System and CISCO Systems are working together on high-tech training centers at 27 campuses. Iowa educators are exploring the creation of a consortium by its 15 public community colleges to deliver courses for associate degrees over the Internet.

Nationally, community colleges are experiencing a trend of more generous allocations from the states. In many cases for the first time in years, finances are available for capital construction. The colleges continue to invest primarily in student-oriented services, however, dedicating about 75 percent of budgets to student-related expenditures. With the technological and demographic changes facing the colleges, strategic planning remains paramount to maintaining effectiveness and viability in the 21st century.

- ☐ Because they receive relatively little state and local funding, independent colleges and universities rely more on tuition and fees than do public colleges and universities.

1. Excludes Pell revenue, which is included in other categories.

- For public community colleges, the percentage of revenue from tuition and fees and from federal sources increased slightly between 1991-92 and 1996-97.

FIGURE 5.1 □ PERCENTAGE OF TOTAL PUBLIC COMMUNITY COLLEGE REVENUE FROM FEDERAL SOURCES AND TUITION AND FEES: 1991-92 TO 1996-97

□ Source: National Center for Education Statistics 1999f

1. Excludes Pell revenue, which is included in other categories.

- Public community colleges receive more than 60 percent of their revenue from state and local sources and about 21 percent from tuition and fees. Public four-year colleges rely less on these sources, receiving 35 percent of their revenue from state and local sources and 18 percent from tuition and fees.

1. Excludes Pell revenue, which is included in other categories.

- The percentage of community college revenue from state and local sources fluctuated between 1991-92 and 1996-97.

FIGURE 5.2 □ PERCENTAGE OF TOTAL COMMUNITY COLLEGE REVENUE FROM STATE AND LOCAL SOURCES: 1991-92 TO 1996-97

□ Source: National Center for Education Statistics 1999f

- The percentage of community college revenue from private sources is small but gradually increasing.
- Examples of miscellaneous revenue include endowment income, sales and services of educational activities, and independent operations.

- Public community college scholarship and fellowship expenditures per FTE student increased slightly between 1991-92 and 1996-97.

FIGURE 5.5 PUBLIC COMMUNITY COLLEGE EXPENDITURES PER FTE STUDENT FOR INSTRUCTION AND SCHOLARSHIPS IN CONSTANT 1996-97 DOLLARS: 1991-92 TO 1996-97

Source: National Center for Education Statistics 1999d and 1999f

- ☐ In fiscal year 1991-92, half the endowments in public community colleges were valued at \$128,669 or higher. By 1996-97, they were valued at \$503,355 or higher.
- ☐ The number of colleges reporting endowment income to the U.S. Department of Education increased steadily between 1991-92 and 1996-97.

- ☐ After controlling for the effects of inflation, community college endowments showed significant increases between 1991-92 and 1996-97, even larger than the increases at public four-year colleges.
- ☐ The number of community colleges with endowments increased by nearly 40 percent between 1991-92 and 1996-97.

1. Based on full-time enrollment two consecutive years (1993-97 and 1997-98).

- The share of federal student financial aid that community college students receive in the form of Pell Grants substantially increased between 1985–86 and 1996–97. The share of funds public community college students receive from other federal student financial aid programs remained constant or decreased slightly over the same period.

- The maximum Pell Grant award funded by Congress has generally increased since the program began in 1973-74. After correcting for the effect of inflation, however, the real value of the Pell Grant was at its peak in the 1985-86 academic year.

- ☐ In 1995-96, the average amount of student financial aid received by public community college students was \$1,890. The average for students attending independent, not-for-profit four-year colleges was \$8,944.
- ☐ Average aid awards tend to be higher for students who take more courses, and higher for financially independent students than for dependent students.

- ☐ Full-time, financially independent students who attend public community colleges are more likely to receive financial aid than are any other type of student attending public community colleges.
- ☐ Less than 2 percent of students attending public community colleges receive merit-based financial aid, whereas more than 15 percent of students attending independent, not-for-profit, four-year colleges receive merit-based financial aid.

1. Student dependency status is based on federal financial aid criteria (see glossary, page 155).

CHAPTER

VI

A LOOK AT THE FUTURE

A LOOK AT THE FUTURE

Historically, there has been little lag time between an economic change or population shift and its impact at community colleges. During their first century, community colleges responded adroitly to the demands of the times. When World War II veterans using the GI Bill packed campuses at the same time industries needed skilled workers to convert from armaments to consumer goods, community colleges added workforce training to their academic repertoire. When the optimism of the 1960s made education the preferred method of remedying social inequities, hundreds of community colleges were built to accommodate new students.

Technology is the driving force behind the newest test of community colleges' agility. So pervasive is technology's influence that it is a factor in most of the demographic, economic, and academic challenges confronting community colleges as they plan for the future.

Technological advances make it possible for more people to live longer. As the overall population increases, community college enrollments are expected to

increase. Technological innovations in the workplace are expected to continue to fuel enrollment by people seeking training or skills upgrades. Demographers predict that the maturation of post-World War II baby boomers' children will send a new influx of traditional college-age students to community colleges in the next decade.

In California, where 1.9 million students attended 106 public community colleges in 1997, enrollments are predicted to grow by 30 percent by 2005.¹ If efforts to enroll a larger proportion of the eligible population are successful, California government officials predict enrollments will grow even more. Much of the population growth in California and nationally is expected among Hispanic and black populations.

Distance learning technologies may increase community colleges' capacity without massive new building projects. Technology also may help accommodate enrollment growth, but it is not the total solution. Technology is expensive. A bad choice in software or hardware means a college is left behind. If a college waits for the technology to stabilize, it risks losing

students to other higher education providers. Community colleges are charged with finding ways to integrate technology to serve more students better at a lower cost.

During the few years of its widespread use, the Internet has intensified competition in higher education by erasing the geographic boundaries that historically defined public community colleges' domains. Electronic delivery of courses has also generated faculty compensation issues and questions about intellectual property rights. These are complex issues, but Colorado Electronic Community College (CECC) and other electronic education consortiums prove they are not insurmountable.

CECC offers several distance learning options, including associate degrees by way of the Internet. Colorado's 12 community colleges jointly develop the courses and share CECC expenses. Tuition revenues are dispersed based on students' designation of their base institutions. A computer network would have been prohibitively expensive even as a joint venture, so CECC uses a commercial

computer server that it pays based on usage. Enrollments have been so good that CECC broke even seven months after starting, well in advance of the three years administrators expected for revenues to cover expenses.

Technology increases the potential for people who live in remote areas to advance their education, but it also carries the risk of cutting out the low-income populations community colleges serve. Financial aid rules are more restrictive for distance education courses. For those who can afford to pay for the courses out of their pockets, accessing the Internet requires a personal computer of fairly recent vintage. Using e-mail is becoming a more common practice for on-campus classes, too, yet owning a personal computer is beyond the means of many community college students.

Cost may eventually cease to be an issue if, as some predict, the personal computer becomes as common as the telephone. But those who persist now without their own computers rely on the space available at campus computer labs, at public libraries, or on friends' machines. For them, accessing the technology that eliminates time and

place constraints on learning becomes another scheduling challenge.

Despite the difficulties involved in mastering new technologies, these skills are vital for employment. Economists Richard J. Murnane and Frank Levy report in their book *Teaching the New Basic Skills* that word processing and other computer skills are essential for attaining work that provides middle-class wages. Reading and computing at a ninth-grade level or above is also on their list of basic skills. They report that employers want people who can recognize problems and solve them by developing hypotheses and testing them; work in groups with people of diverse backgrounds; and speak and write effectively.

Because of technological advances in communication and transportation, foreign trade is growing, even among small businesses in remote corners of the nation. Consequently, more businesses are looking for people with an understanding of international issues. Faculty and student exchanges, in which some community colleges already participate,

provide useful firsthand information and help dispel stereotypes. While such international programs are not available at every college, pressure is increasing for community colleges to foster an awareness of foreign cultures and the interconnected nature of the world economy.

Constraints on public funds show no signs of abating, as more legislatures predicate budget increases upon performance of specific goals. Competition is pushing community colleges to consider students as customers whose instruction and services should be delivered at the time, location, and pace of the students' choosing. In turn, emphasis on students' learning is growing as employers and society expect students to demonstrate competence in what they have been taught.

The flexibility of community colleges will be tested in the future as never before. Time will tell whether the pressures upon community colleges transform them in fundamental ways or elicit minor adjustments. Community colleges' history of ingenuity and resiliency makes them strong contenders for the 21st century.

- The number of people aged 18 to 24 will rise through the first half of the 21st century.

FIGURE 6.1 □ U.S. POPULATION AGED 18 TO 24, WITH ALTERNATIVE PROJECTIONS: 1990 TO 2050 (IN THOUSANDS)

□ Source: U.S. Bureau of the Census 1996

- The number of high school graduates is projected to continue increasing at least through 2008.

FIGURE 6.2 □ NUMBER OF HIGH SCHOOL GRADUATES, ACTUAL AND PROJECTED: 1983 TO 2008 (IN THOUSANDS)

□ Source: National Center for Education Statistics 1998b

- Following a slight decline, the number of associate degrees conferred is expected to increase by 11 percent by 2007–08.

FIGURE 6.3 □ NUMBER OF ASSOCIATE DEGREES CONFERRED, ACTUAL AND PROJECTED: 1982–83 TO 2007–08

□ Source: National Center for Education Statistics 1998b

- Per-FTE-student expenditures are projected to rise faster than the cost of inflation, largely because of costs related to technology.

GLOSSARY

ACADEMIC SUPPORT: expenditures for support services that are an integral part of the institution's primary mission of instruction, research, or public service.

ASSOCIATE DEGREE: an award that normally requires at least two but fewer than four years of full-time-equivalent college work.

BEGINNING POSTSECONDARY STUDENT STUDY (BPS): a longitudinal study that followed first-time freshmen for five years. It is a subsample of the students who started college in the 1989–90 NPSAS study with the last follow-up in 1994.

BOOK VALUE (LAND, BUILDINGS, EQUIPMENT): dollar amount value as shown on the institution's accounting records. The purchased or construction cost at time of purchase, construction, or donation.

BRANCH CAMPUS: an affiliated campus of a college that is not separately accredited and does not separately offer a degree.

CAMPUS-BASED AID: student financial aid from federal, state, and local governments administered through the institution, not directly to the student. An example is College Work-Study.

CERTIFICATE: a formal award certifying the satisfactory completion of a postsecondary program.

COLLEGE WORK-STUDY: a program in which a student is paid through federal

and matching institutional funds for work on the campus or on its behalf.

COMMUNITY COLLEGE (AACC DEFINITION): an institution that is accredited (or undergoing accreditation) by one of the six regional accrediting bodies and primarily offers the associate degree as the highest degree. A community college can also be a campus that offers the associate degree as the highest award but is part of a regionally accredited, baccalaureate degree-granting institution.

COMMUNITY COLLEGE (U.S. DEPARTMENT OF EDUCATION DEFINITION): an institution of higher education that is accredited by an agency recognized by the Department of Education and offers the associate degree as the highest award.

CONSTANT DOLLARS: the value of the dollar adjusted for the impact of inflation. The Consumer Price Index was used to adjust for the effects of inflation.

CURRENT DOLLARS: the actual dollar value, not adjusted for inflation.

CURRENT POPULATION SURVEY (CPS): a monthly survey of about 50,000 households conducted by the Bureau of the Census for the Bureau of Labor Statistics. Respondents are interviewed to obtain information about employment status of each member of the household aged 15 or older.

DEGREE-SEEKING STUDENTS: students enrolled in courses for credit who are recognized by the institution as seeking a degree or formal award.

DEPENDENT STUDENT: See student dependency status.

EMPLOYMENT STATUS (FACULTY AND STAFF): full-time or part-time status as determined by the institution.

ENDOWMENT VALUE: funds that are part of the college's endowments and other foundation activities.

FALL HEADCOUNT ENROLLMENT: the number of students enrolled in courses creditable toward a diploma, certificate, degree, or other formal award on October 15 (or the institution's official fall reporting date). Includes students who are part of vocational or occupational programs and students enrolled in off-campus centers.

FEDERAL AID: any student financial aid provided by the federal government.

FEDERAL REVENUE: includes both restricted and unrestricted appropriations, grants, gifts, and contracts from federal sources, except for Pell Grant dollars, which are separately reported, unless otherwise noted.

FIELD OF STUDY: the primary field of study a degree or certificate was awarded in, as classified by the institution based on

guidelines developed by the U.S. Department of Education.

FIRST-TIME, FIRST-YEAR STUDENT: a student attending any institution for the first time at the undergraduate level.

FOUR-YEAR COLLEGE: a college that offers a baccalaureate or higher degree as its primary award.

FULL-TIME EMPLOYMENT: 35 or more hours per week.

FULL-TIME STUDENT: a student enrolled for 12 or more credits (24 or more contact hours a week).

FULL-YEAR, UNDUPLICATED HEADCOUNT: the number of students enrolled during the 12-month reporting period in any courses leading to a degree or other formal award, and students enrolled in courses that are part of a terminal vocational or occupational program.

INDEPENDENT (PRIVATE) COLLEGE: a college operated by privately appointed officials and which derives its funding primarily from private sources.

INDEPENDENT STUDENT: See student dependency status.

INSTITUTIONAL AID: any aid the college provides to the student to help defray the cost of attending the college.

INSTITUTIONAL SUPPORT: expenditures for day-to-day operations established to provide service and maintenance of grounds and facilities used for educational and general purposes.

INSTRUCTION: category of expenditures that includes all expenditures for instruction and instructors' salaries, including both credit and noncredit academic instruction.

INTEGRATED POSTSECONDARY EDUCATIONAL DATA SYSTEM (IPEDS): a series of surveys conducted by the U.S. Department of Education. The surveys provide aggregate data at the college level and cover topics such as enrollment, institutional finances, institutional characteristics, degree and certificate completion, staff and faculty status, faculty salaries, and, soon, student graduation and transfer activities.

INTERNATIONAL PROGRAMS: programs that deal with training individuals in countries other than the United States or programs that specialize in teaching about other countries.

LEVEL: the highest degree primarily offered by the community college, versus a four-year college.

LOCAL REVENUE: category of revenue that includes both restricted and unrestricted appropriations, grants, gifts, and local sources, unless otherwise noted.

NATIONAL POSTSECONDARY STUDENT AID STUDY (NPSAS): a survey conducted every three years by the U.S. Department of Education. Data is collected on a stratified random sample of students from all levels of postsecondary institutions eligible for student financial aid; the best source for nationally representative data on financial aid, student finances, and other individual student characteristics.

NATIONAL STUDY OF POSTSECONDARY FACULTY (NSOPF): a survey conducted every six or so years by the U.S. Department of Education. Data is collected on a stratified random sample of instructional faculty from all levels of postsecondary institutions. NSOPF is one of the best sources of information available about faculty at community colleges.

NFP: not for profit.

PART-TIME EMPLOYMENT: fewer than 35 hours per week.

PART-TIME STUDENT: a student enrolled for 11 or fewer credits (fewer than 24 contact hours a week).

PELL GRANT: federally funded grants to students based on family financial need; includes all federal Pell Grant funds received by the college.

PER CAPITA (STATE): total amount of funds divided by the total population of the state.

PERSISTENCE: whether a student is still pursuing a degree or certificate by attending a postsecondary institution.

PRIVATE GIFTS, GRANTS, AND CONTRACTS: revenues from private donors, private contracts, and foreign governments.

PUBLIC COLLEGE: a college that is operated by publicly elected or appointed officials and that derives its funding primarily from public sources.

PUBLIC SERVICE: category of funds budgeted to provide noninstructional services beneficial to groups external to the institution.

RACIAL/ETHNIC BACKGROUND: racial or ethnic category that individuals identify with, according to the terminology used by the U.S. Department of Education: black, non-Hispanic; American Indian or Alaskan native; Asian or Pacific Islander; Hispanic; white, non-Hispanic.

REMEDIAL EDUCATION: courses in reading, writing, or mathematics for college students lacking the skills necessary to perform work at the level required by the institution.

REPLACEMENT VALUE: estimated cost to replace buildings and equipment owned, rented, or used by the institution.

RESEARCH: funds spent to produce research outcomes commissioned by an

agency either external to the institution or separately budgeted by an organizational unit within the institution.

SERVICE LEARNING: a program integrated into curriculum in which a student volunteers as part of his or her coursework and integrates this service activity into the learning experience.

STATE AID: any student financial aid provided by a state government.

STATE REVENUE: category of revenue that includes both restricted and unrestricted appropriations, grants, gifts, and contracts from state sources, unless otherwise noted.

STUDENT DEPENDENCY STATUS: dependency status of students according to Federal Student Financial Aid Guidelines. Students were considered independent if they met any of the following criteria:

- Student was age 24 or older as of December 31, 1995.
- Student was a veteran of the U.S. Armed Forces.
- Student was enrolled in a graduate or professional program (beyond a bachelor's degree) in 1995–96.
- Student was married.
- Student was an orphan or ward of the court.
- Student had legal dependents other than spouse.

In addition, financial aid officers may designate students who do not meet

these criteria to be independent if the students can document they are in fact self-supporting.

STUDENT FINANCIAL AID: any of a wide variety of programs designed to aid a student financially to attend a postsecondary institution.

STUDENT SERVICES: expenditures for admissions, registrar activities, and activities whose primary purpose is to contribute to students' emotional and physical well-being and to their intellectual, cultural, and social development outside the context of the formal instructional program.

SUBSIDIZED LOANS: loans to students to help defray attendance costs, where interest accrual is paid for while the student is still pursuing a degree. Includes Perkins loans and some Stafford loans.

TRANSFER: academic transition in which a student stops attending one college to begin attending another, often with credits earned at the first institution transferring to apply for credit at the second institution.

TRIBAL COLLEGE: a college operated by one of the Native American nations.

TUITION AND FEES: the average annual amount an individual spends to attend classes on a full-time basis. Tuition and fees do not include books and supplies,

room and board expenses, or living expenses.

UNSUBSIDIZED LOANS: loans to students to help defray attendance costs, where interest accrues to the student's loan amount while he or she is still pursuing a degree. Unsubsidized loans include PLUS, SLA, and some Stafford loans.

VIDEOCONFERENCING: using one-way or two-way video telecommunications as part of an educational experience.

WORKFORCE TRAINING: educational programs designed to increase skills needed for specific workplace jobs.
